

UniswapV2 Deployment

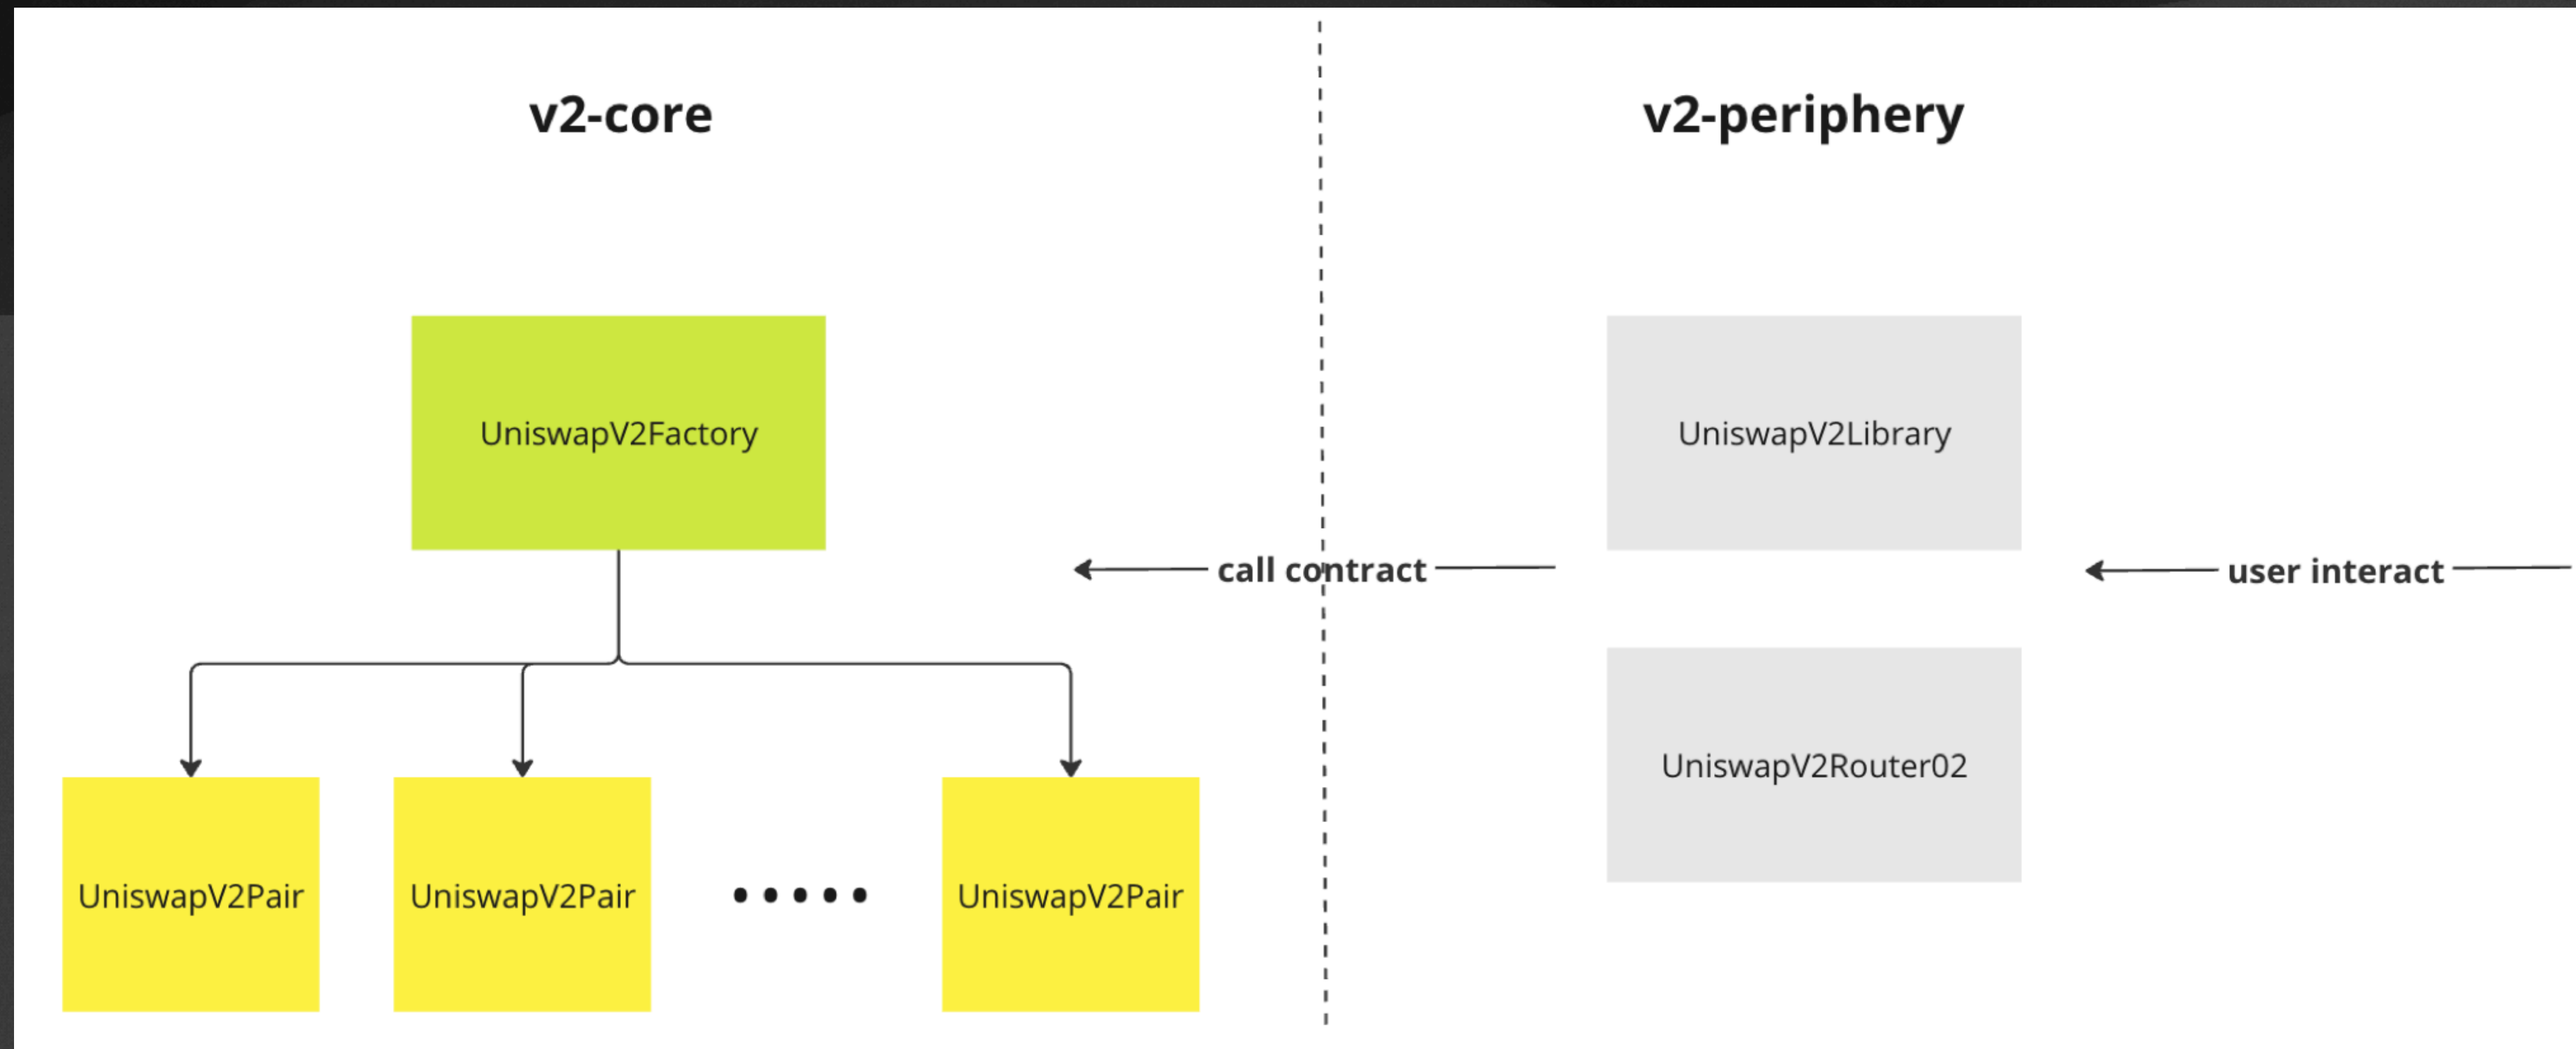

Justin 109611065

Why Development of UniswapV2?

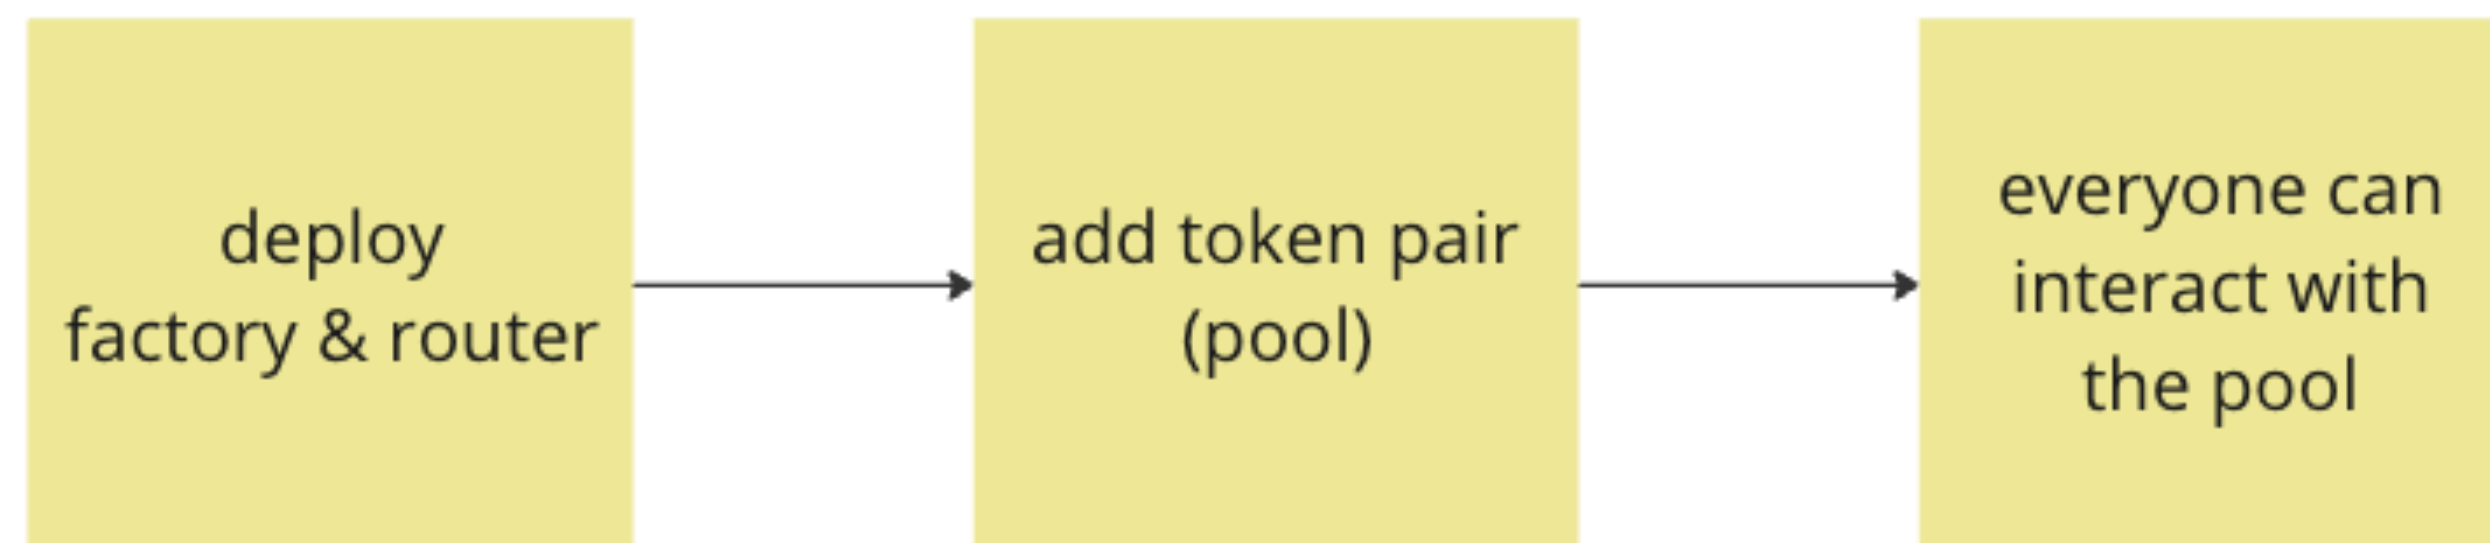

- **Current Ecosystem:** user typically directly interact with swap pools on the uniswap app
- **Solution:** create a front-end that user can deploy their own pool and also interact with them, without using the uniswap app

Contract Architecture

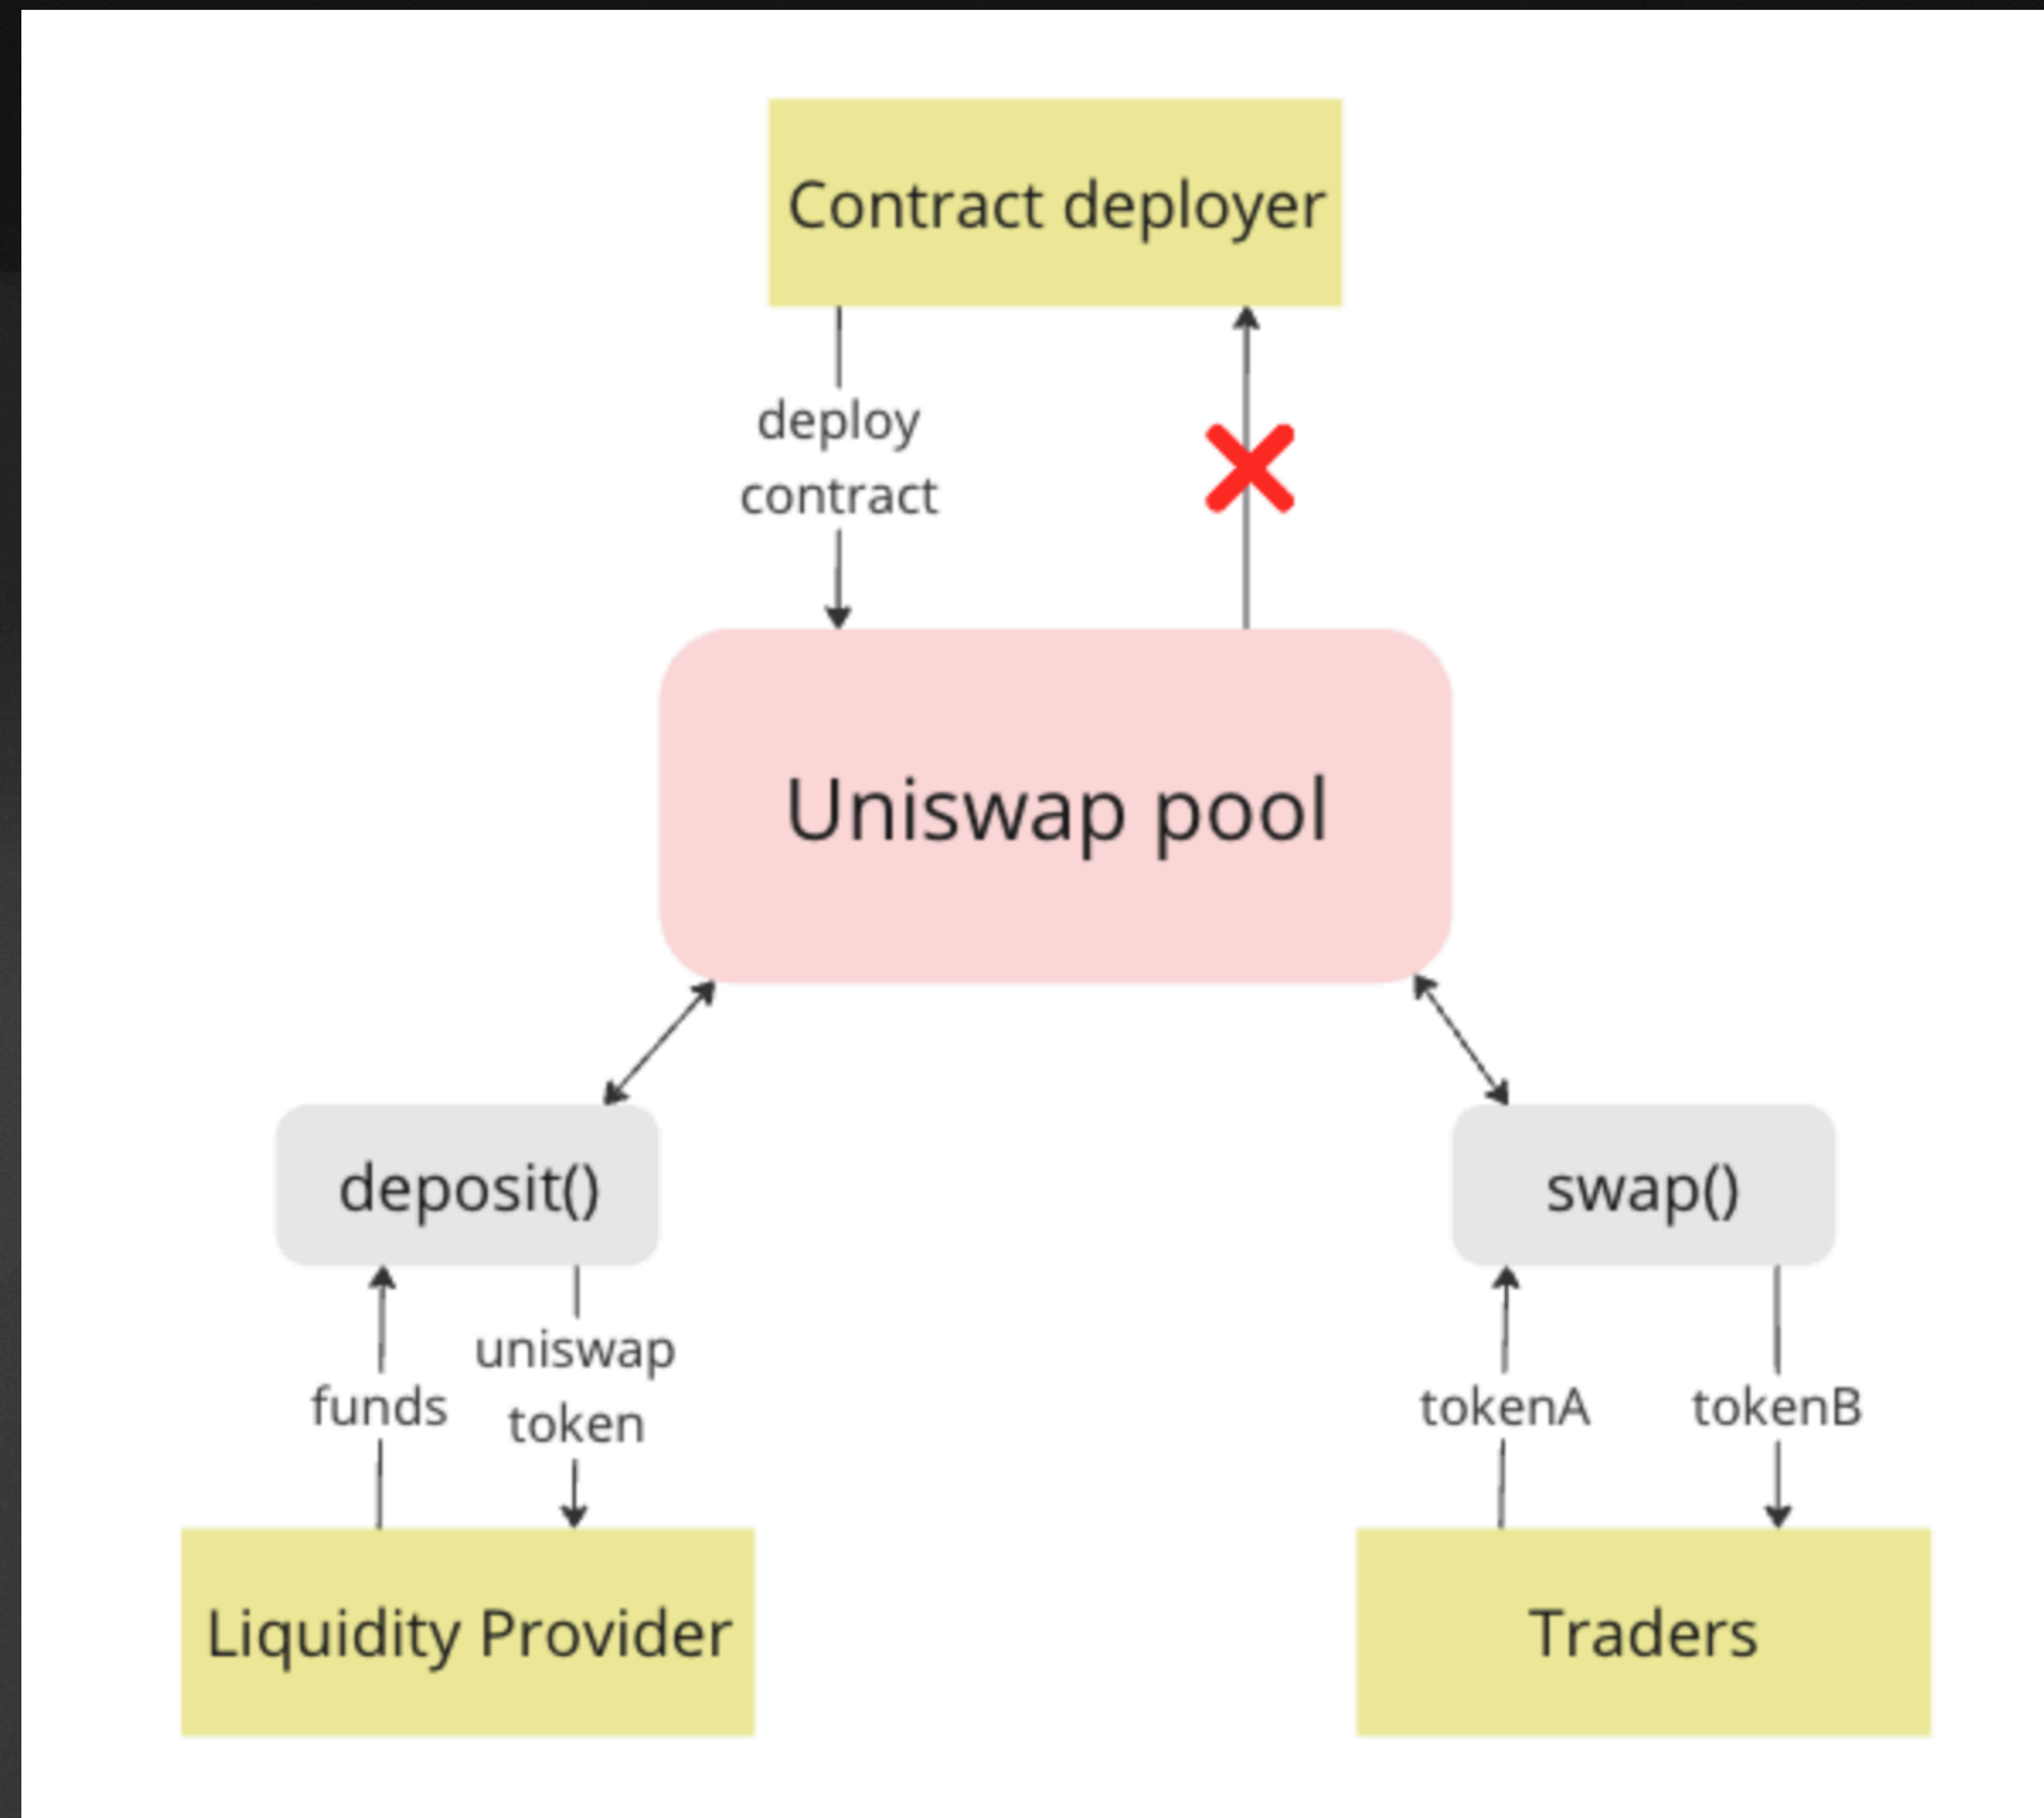

- factory: factory contract that deploys all the pairs (using create2)
- pair: act as an AMM and also a ERC-20 contract for pools
- router, library: contract with frontend offering functions
